User & Onboarding Flows

End-to-end lifecycle for every role on the platform

Internal Reference Document

1. Onboarding Flows (By Role)

CEO (The Founder)

Bootstrapped automatically during system initialization with default admin credentials. First task: create initial Departments (Frontend, Backend, etc.) and promote the first set of Admins.

Admin (Operations)

Registers as a standard user. The CEO updates their role to Admin via PUT `/api/v1/users/update`. Responsible for managing global state, approving products, and overseeing financial withdrawals.

Manager (Department Lead)

Registers as a standard user. CEO or Admin updates their role to Manager and assigns them as `manager_id` to a specific Department. Responsible for reviewing applications, creating projects, and assigning tasks.

Member / Applicant (The Talent)

Step 1 - Registration: Signs up via POST `/api/v1/auth/register` (Member role, pending status).

Step 2 - Application: Submits via POST `/api/v1/applications/apply` with GitHub and Portfolio links.

Step 3 - Review: A Manager reviews the application.

Step 4 - Activation: Approval via PUT `/api/v1/applications/approve` sets status to approved.

Client (The Customer)

Registers as a standard user. CEO or Admin verifies intent and updates role to Client. Once assigned, the Client can access Project Requests and client-specific features.

2. The Hire Our Service Flow (Client User Flow)

Step 1 - **Request:** The Client submits a project proposal via POST `/api/v1/projects/client/request-project`.

Step 2 - **Consultation:** A Manager schedules a meeting via POST `/api/v1/meetings/create`. The Client receives an email and WebSocket notification.

Step 3 - **Activation:** After the meeting, the Manager sets the project to active and assigns a team of Members.

Step 4 - **Execution:** Members work on assigned Tasks. The Client monitors progress through the project dashboard.

Step 5 - **Payment:** Upon completion, the Client pays via the integrated Stripe checkout.

Step 6 - **Auto-Completion:** The Stripe Webhook receives payment confirmation and automatically sets status to completed.

Step 7 - **Profit Split:** Background task process_payout_calculation allocates **70%** to Members and **30%** to Company Wallet, recording all Transactions.

3. The Work & Earn Flow (Member User Flow)

Step 1 - **Assignment:** Member is added to a project and assigned specific tasks.

Step 2 - **Notification:** Member receives a real-time WebSocket notification when a new task is assigned.

Step 3 - **Progress:** Member moves tasks from in_progress to completed.

Step 4 - **Earnings:** Once the project is marked completed (via Client payment), the Member's Wallet is automatically credited with their share.

Step 5 - **Withdrawal:** Member requests a payout via POST `/api/v1/financials/withdrawals/request`. Amount is placed in escrow while an Admin reviews and marks it as paid.

4. Product Integration Flow (External Revenue)

Step 1 - **Registration:** Admin adds an external product (e.g., a SaaS app) via POST `/api/v1/products/add`.

Step 2 - **API Key:** The system generates a unique api_key for that product.

Step 3 - **Reporting:** The external product sends periodic revenue reports via POST `/api/v1/revenue/report`.

Step 4 - **Treasury:** Funds are automatically added to the Company Wallet, allowing the CEO to track global earnings across all TitanCode products.
